

The Bellbird, also known as the Korimako, is a small native bird found throughout New Zealand's forests and bush areas. It is known for its beautiful and distinctive bell-like song, which can be heard throughout the day. Bellbirds have a unique feeding habit - they prefer nectar from flowers and trees rather than insects or seeds. They also have a special brush-tipped tongue that allows them to collect nectar from deep

within flowers. Bellbirds are an important part of New Zealand's natural ecosystem as they help to pollinate plants and spread their seeds. Unfortunately, their numbers have declined in some areas due to habitat loss, predation by introduced mammals, and competition with other bird species. However, conservation efforts are helping to protect and restore Bellbird populations across the country.
