

Submarines are underwater vehicles that are used by the Navy to carry out various tasks such as reconnaissance, surveillance, and attacking enemy vessels. They are designed to operate underwater for long periods of time and can travel at high speeds without being detected. Submarines are equipped with a variety of advanced technologies such as sonar

and periscopes, which allow the crew to see and hear

what's going on around them. They also have torpe-

does and missiles that can be launched at enemy tar-

gets. Submarines come in different sizes, with some

being as small as a few meters long, while others can

be over 100 meters long.
